This document summarizes selected data on health and wellbeing in the county. The aim is to present comparable and standardized health indicators. This information gives input to the regional planning of services for improving the health and wellbeing of inhabitants.

It is compiled by specialists of National Institute for Health Development, in collaboration with Ministry of Social Affairs and Statistics Estonia.

Additional information about the data used in the overview can be found online at: www.terviseinfo.ee/maakonnatervis

## STRUCTURE OF HARJU COUNTY'S

 POPULATION

[^0]Population: 558017 (01.01.2011)
Percentage of Estonian population: 42 \%
Area: $4333,13 \mathrm{~km}^{2}$
Population density: 127,5 inhabitants per $\mathrm{km}^{2}$
County centre: Tallinn (400 214 inhabitants)
Municipalities: 24, incl. 6 urban and 18 rural
Economic activity: real estate, wholesale and retail trade, construction, transport, storage, communications, manufacturing industry

## POSTITIVE DEVELOPMENTS

The highest positive migration balance in Estonia and a positive rate of natural increase
$\Sigma$
The lowest percentage of elderly in county populationHigh gross wages and employment rate
$\Sigma$
Low at-risk-of poverty rate

Lowest mortality rate from diseases of circulatory system in Estonia
$\Sigma$
High proportion of people who rate their health good or very good
$\Sigma$
Lowest rate of work-related accidents in Estonia

## CHALLENGES

$D$
Above average proportion of overweight schoolchildren
$\Sigma$ Below average proportion of working-age people with health insurance
$\square$ The spread of sexually transmitted diseases (including HIV)

D High incidence rate of cancer
Regular consumption of alcohol among population
High rate of violent offences

Self-rated health (good and very good)

## At-risk-of-poverty rate

Overweight and obese children

## Administrative capacity of the municipalities

1-Vas alemma
2 -Keila tom
3-Saue town
4-Maardu
5 - Loks a
Index of administrative capacity
highest $\begin{array}{lllll}70 & 60 & 50 & 40\end{array}$

The index of administrative capacity is calculated using 26 indicators from six domains: population and area of the municipality, strength and diversity of local economy, wellbeing of inhabitants of the muni cipality, financial situation of the municipality, strength of the municipality's administration, and volume and diversity of the munici pality's public services.
Administrative capacity of a municipality is expressed both in administrative ability and the general results of the administration on the territory of municipality. The map shows the index of administrative capacity in municipalities, average for the years 2006-2009.

## Burden of disease in the municipalities

Burden of disease is calculated based on morbidity and mortality statistics; in addition the gravity of disease and people's age at the time of death are taken into account.

Burden of disease indicates how many years of life inhabitants have lost due to diseases and mortality. These are life years that people could have lived healthily, if there had not been the disease or death. Burden of disease is used as an indicator for comparing regions to each other or mapping the developments in time. The map shows years of life lost per 1000 inhabitants in 2006.
